

# SAN LUIS REY RIVER PARK MASTER PLAN

COUNTY OF SAN DIEGO  
DEPARTMENT OF PARKS AND RECREATION

## EXECUTIVE SUMMARY

The Master Plan document is organized in the following chapters:

### **I. Introduction**

The introduction includes an overview and explanation of the San Luis Rey River Park (SLRRP) Master Plan, the planning process, the planning context, and primary goals for the San Luis Rey (SLR) River Park.

### **II. Community Input**

This planning process was facilitated by public input gathered through four public meetings, Master Plan Advisory Group (MPAG) meetings, multiple focus group meetings, and written surveys. Community input early in the planning process and feedback in response to planning alternatives was essential to the Master Plan process and the development of the Final Plan.

### **III. Analysis and Synthesis**

Site analyses consisted of studying existing physical and perceptual conditions within the CSA, as well as a records search and assessment of the biologic and cultural resources. Much of the more detailed analyses focused on the sensitive biologic resources within this segment of the river corridor. The San Luis Rey River corridor is also rich in Native American resources, with many different tribal groups having historical and current ties to the San Luis Rey River. Analyses were compiled into

a series of topical white papers, each of which summarized primary opportunities and constraints of SLR River Park development.

Desired park amenities were identified through public surveys, public input at community meetings, MPAG input, County Department of Parks and Recreation priorities for the project, and a review of similar precedent parks. An assessment of the existing recreational facilities within the park's anticipated service area, and the current needs of the community informed recommendations regarding quantities and distribution of proposed recreational amenities within the larger River Park CSA. Population densities and park-related traffic impacts were also analyzed to determine appropriate locations for active park uses.

### **IV. Master Plan**

After thorough analyses of the CSA and the needs of the community, two basic planning/programming alternatives were developed. Based on further feedback from the public, MPAG, and focus groups, a Preferred Plan was then created, combining preferred elements of the two Planning Alternatives. The Final Plan integrates refinements of the Preferred Plan with more elaborated design and programming concepts for potential active park sites. The documentation of the planning process will allow subsequent users of this document to understand not only conclusions and planning

recommendations, but also how and why conclusions were reached. Finally, the anticipated park implementation process is described. Although the County is currently in the process of seeking the acquisition of high-priority properties for park development, implementation of park improvements will only occur after the County has completed an Environmental Impact Report.

### **V. Appendices**

After extensive study and documentation of the physical and cultural attributes of the CSA, this data was synthesized into a series of opportunity and constraint diagrams and white paper reports that clarified opportunities and constraints for park development relating to environmental, cultural, biologic, hydrologic, and water quality aspects of the river corridor. Through this synthesis, potential park development sites were identified and evaluated in terms of ability to accommodate various desired park amenities. These reports are summarized within the Analysis and Synthesis Chapter (III), but can be found in their entirety in the appendices.

## FINAL PLAN

### SLR River Park Vision

The Master Plan outlines the creation of a dynamic open space legacy balancing recreation and preservation/ restoration/ interpretation of the San Luis Rey River's outstanding biological and cultural resources.

### Planning Process

The Final Plan is the product of data gathering and analysis, coordination with other ongoing initiatives, extensive public input (MPAG, focus groups, surveys, public meetings), an evaluation of park program, site assessments, and discussions with current property owners.

### River Park Components

The SLR River Park will be composed of three fundamental components: +/-1600-acre open space preserve, +/- 40 acres of active recreational amenities, and a network of multi-use trails that stitch the park together internally while linking it to surrounding communities.

Final Plan

### Open Space Preserve

The heart of the park will be a +/- 1600-acre open space preserve, protecting in perpetuity a contiguous section of one of the County's biologically-rich river corridors, and providing critical habitat for several threatened and endangered species.

### Recreational Amenities

The Final Plan defines +/- 40 acres of active recreational park development distributed between four Tier A park sites, in addition to numerous opportunities for smaller passive park nodes.

### Multi-use Trail Network

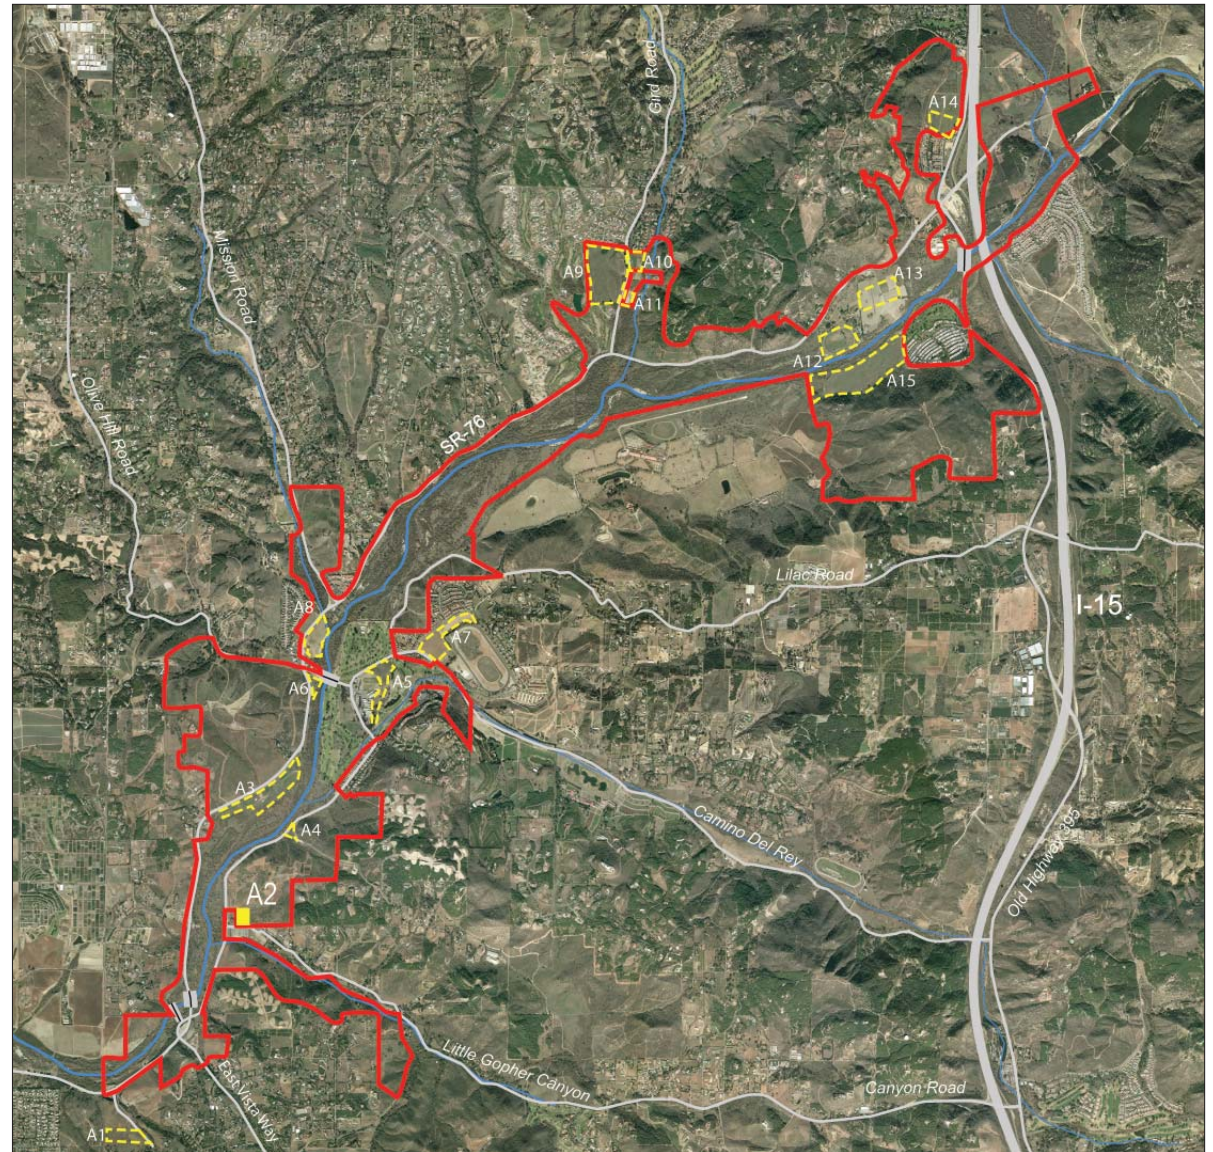

A network of multi-use trails will provide thorough access to the park's diverse resources and amenities. Trail bridges will allow year-round circulation within the river corridor, while (a) trail underpass(es) enhance connectivity between riparian and upland areas.

Final Plan

## A2- LITTLE GOPHER CANYON SITE

Site A2, the Little Gopher Canyon site, is one of the smallest Tier A sites, at approximately 4 acres. It is located near the intersection of Little Gopher Canyon Road and Old River Road. The existing conditions on site vary: the front half of the site is flat (next to the road) while the back half slopes up towards the hills. The front half is partially disturbed and partially vegetated with non-native grasslands, while the back has scrub/ chaparral vegetation. The site is outside of the 100-Year floodplain and contains no known cultural resources.

A2- Vicinity Map

## A2- CONCEPT DESIGN

A2- Concept Design

Because the Little Gopher Canyon site is isolated from the river corridor, it provides a good opportunity for a dog park (unleashed dogs are not compatible with sensitive habitat areas), combined with picnic and passive park facilities.

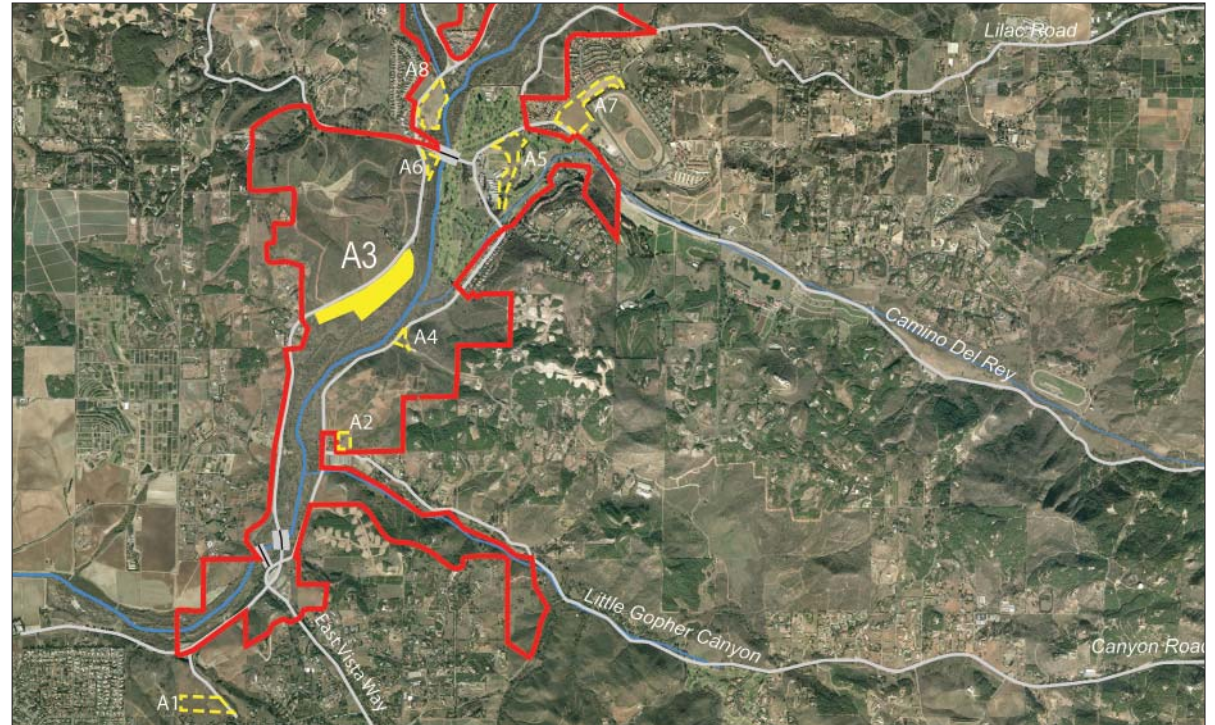

Located at the intersection of Old River Road and Little Gopher Canyon Road, this site also could be a very convenient trailhead and parking/ staging area for trails along the south side of the River Park. Many equestrians live and/ or board their horses along Little Gopher Canyon Road, making a parking/ staging area a logical use for a portion of this site.

Across Old River Road is the abandoned Walnut Grove Site, an ideal location for Tier B park uses such as a picnic area, adjacent to the riparian zone.

The Planning Team recommends possible habitat restoration along the east half of the site as an expansion of adjacent habitat areas.

### A3- MODEL AIRPLANE SITE

Site A3, the Model Airplane Site, is a proportionately long and narrow +/- 27-acre site, partially within the 100-year floodplain. The site is covered in non-native grasses and it is periodically mown to retain its disturbed condition. It is a relatively flat site (less than 10% slope) and is located both near the Bonsall School and Oceanside, at the southern end of the CSA. Currently, part of the site is used for model airplane flying.

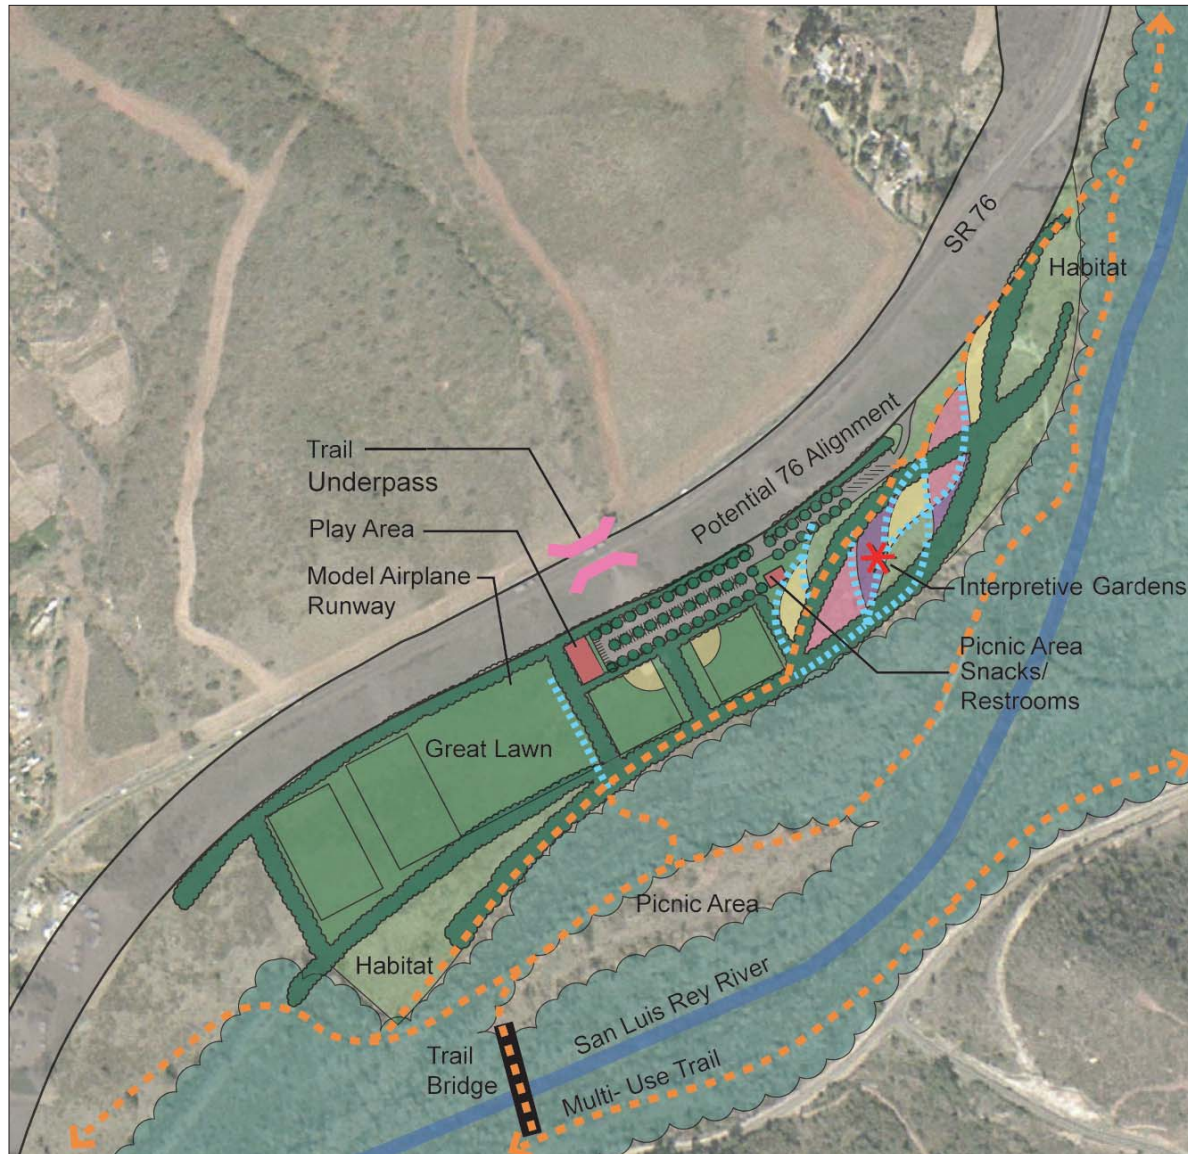

A3- Vicinity Map

A3- Existing Site Conditions

## A3- CONCEPT DESIGN

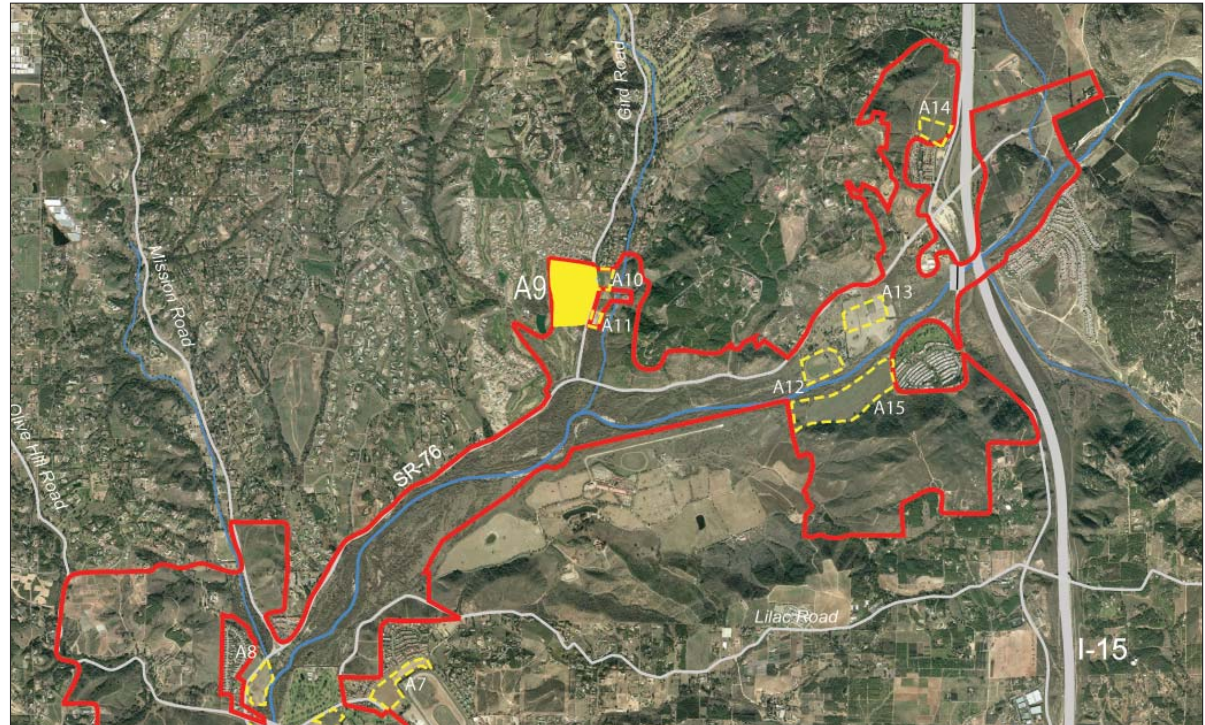

A3- Concept Design

Located between the river and SR-76, Site A3 has great access from both the road and the river trail system. Because it is partially within the 100-year floodplain, it is a prime location for park development. The lack of sensitive vegetation, cultural resources, and shallow slope gradients allow for many programming possibilities. Site A3 would be a prime location for a significant active recreation node and staging area because of its proximity to the Bonsall School and the residences of the southern end of the CSA.

Primary park spaces are defined by a series of sinuous interwoven tree ribbons which reference the shifting riverbed as it moves across the broader floodplain. This concept design accommodates two baseball fields and up to three soccer fields. The multi-use Great Lawn could be used for gatherings, informal sports, and model airplane flying. Additionally, an Interpretive Gathering Area and Interpretive Gardens would be well located on this site due its great access to the river resources and the trail network. Significant riparian habitat restoration would also be possible along the northeast edge of this large site, with the Interpretive Gardens buffering it from the active recreational fields.

## A9- FALLBROOK HIGH SCHOOL SITE

Site A9, the Fallbrook High School Site, is presently owned by the Fallbrook High School District, although they have determined that is not well suited for the development of a new high school. The +/- 42-acre site is covered in non-native grasses punctuated by peripheral groves of eucalyptus and oak trees. The site straddles a flat ridge overlooking the river corridor (completely out of the 100-year floodplain). It is located along Gird Road, approximately 1/3 mile north of SR-76. While most of the site is under 10% slope, the site's southern edge, defined by a series smaller ridges and valleys, is significantly steeper. The spectacular views and shallow rolling topography distinguishes this site from all other potential Tier A sites while providing unique programming opportunities.

A9- Vicinity Map

A9- Existing Site Conditions

Precedent Gathering Space Photo

## A9- CONCEPT DESIGN

A9- Concept Design

The flattest northwest corner of the site provides a good opportunity for two football/ soccer fields framed by tree rows (part of the existing site vocabulary) that block winds while retaining views over the river corridor. Parking for the sports fields should be provided along the north edge of the site.

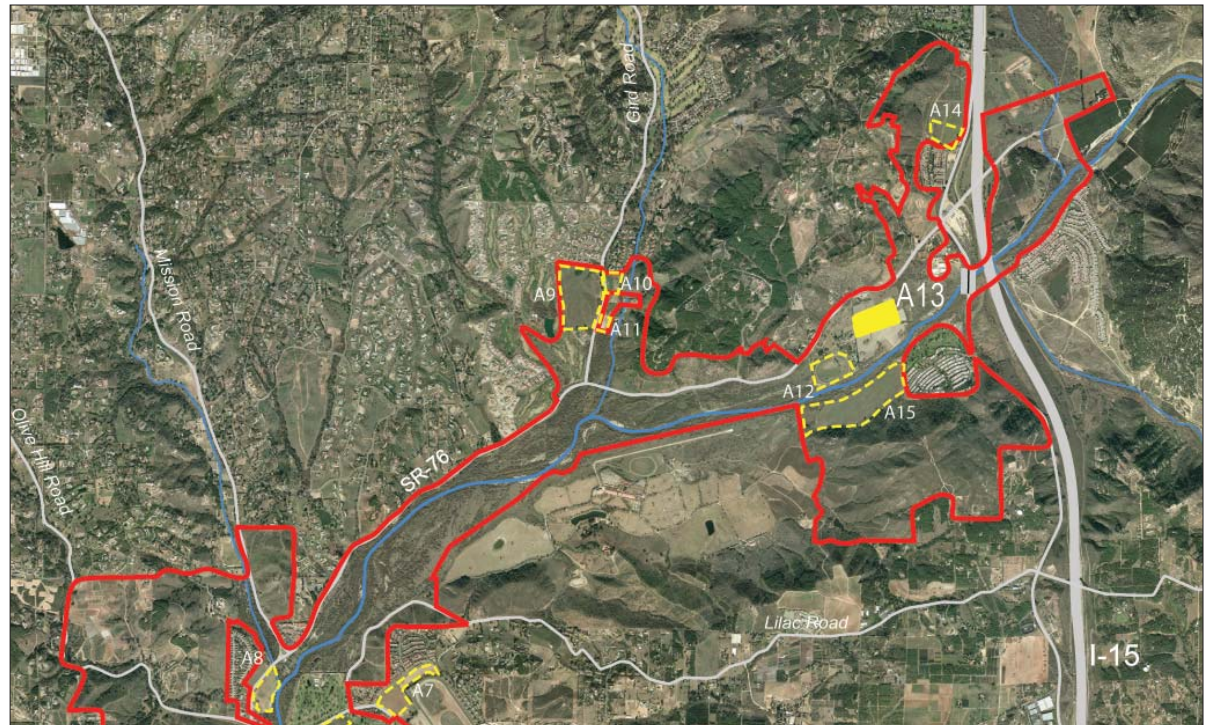

The proposed community gathering area would naturally fit into one of the site's shallow southern valleys. The gathering area would be planted with a loose grove of shade trees, and terraced to maximize views. The site would be protected from sun (shade trees) and winds (topography), while commanding spectacular views over the river corridor. The site's location in the center of the CSA would make it easy to access from either end of the River Park. The community gathering area could accommodate diverse performances and small events such as local plays or Native American gatherings, while also serving as a shaded picnic grove for smaller groups. A separate parking/ staging area along the Gird Road provides necessary gathering area parking and access to the northern upland trail system.

The majority of the site should be preserved/ restored as open grassland habitat with nominal additive improvements such as trail improvements and park benches.

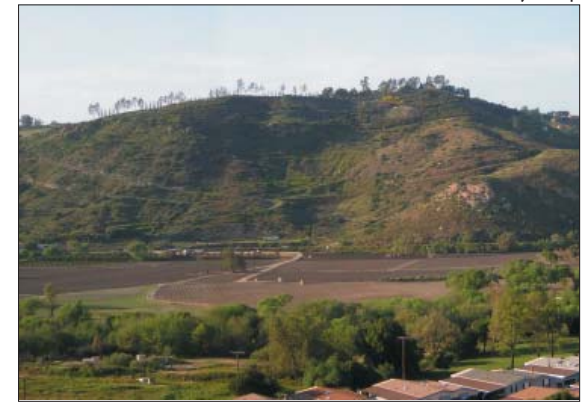

## A13- SAN DIEGO COUNTY WATER AUTHORITY SITE

Site A13, presently owned by the San Diego County Water Authority, is a +/- 10-acre agricultural site adjacent to both SR-76 and the river corridor. Located near the SR-76/ I-15 intersection, this is the most visually prominent and easily accessible of the potential Tier A sites. For these reasons, Site A13 could serve as an effective and dramatic park gateway for the larger River Park.

The site is gently sloped towards the river and would not require significant grading to accommodate recreational fields and other Tier A programming.

A13- Vicinity Map

A13- Existing Site Conditions

## A13- CONCEPT DESIGN

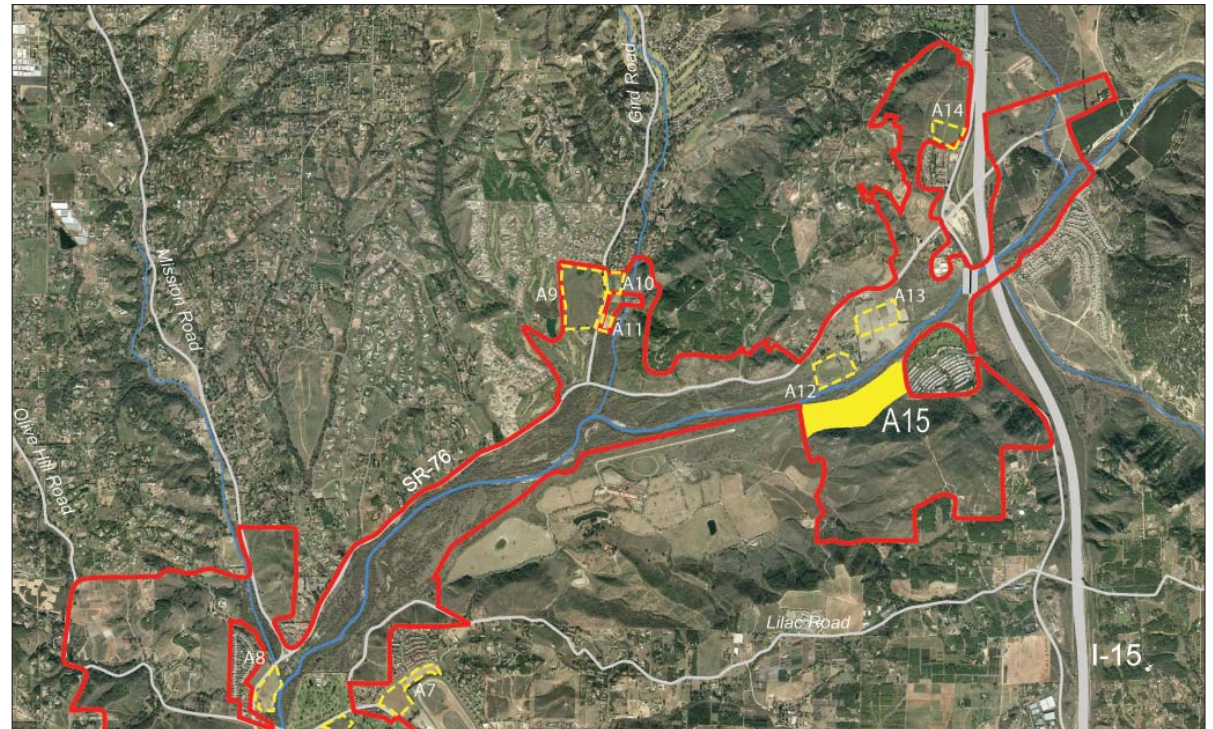

A13- Concept Design

Located at the northeast end of the CSA, Site A13 could support sports fields, parking, and a staging area as well as considerable riparian restoration and arroyo toad habitat creation. The concept plan indicates overlapping multi-use sports fields: three soccer fields or two baseball fields. The sports fields are surrounded by a tree buffer to block winds and provide a greater degree of light containment. Recreational amenities would especially benefit park users living near this end of the CSA as well as those arriving to the park from I-15. Park-related traffic along SR-76 will be minimized by locating park amenities at both ends of the CSA.

The Planning Team positioned this park node far enough away from existing SR-76 to allow for the potential expansion/realignment of the highway. In the event that the highway is not relocated southward, the concept design could be moved closer to the existing highway, allowing more room for riparian restoration. Parking lots, permanent architectural structures, and utilities should be located along the SR-76 edge of the park, on the highest ground available, to minimize flood-related maintenance. The consolidated parking/ staging area will include horse trailer parking at one end. Multi-use park trails are located outside of the tree buffers to separate horses from areas of high activity.

## A15- VESSELS EAST SITE

At +/- 54-acres, Site A15, Vessels East, is the largest potential Tier A site. It is presently owned by Frank Vessels Family Trust and is categorized as agricultural land. It is regularly mown to retain its disturbed condition. The northern half of the site falls within the 10-year floodplain. Access to the site would be provided from Old Highway 395. The site is relatively flat, making it an ideal site for Tier A park programming.

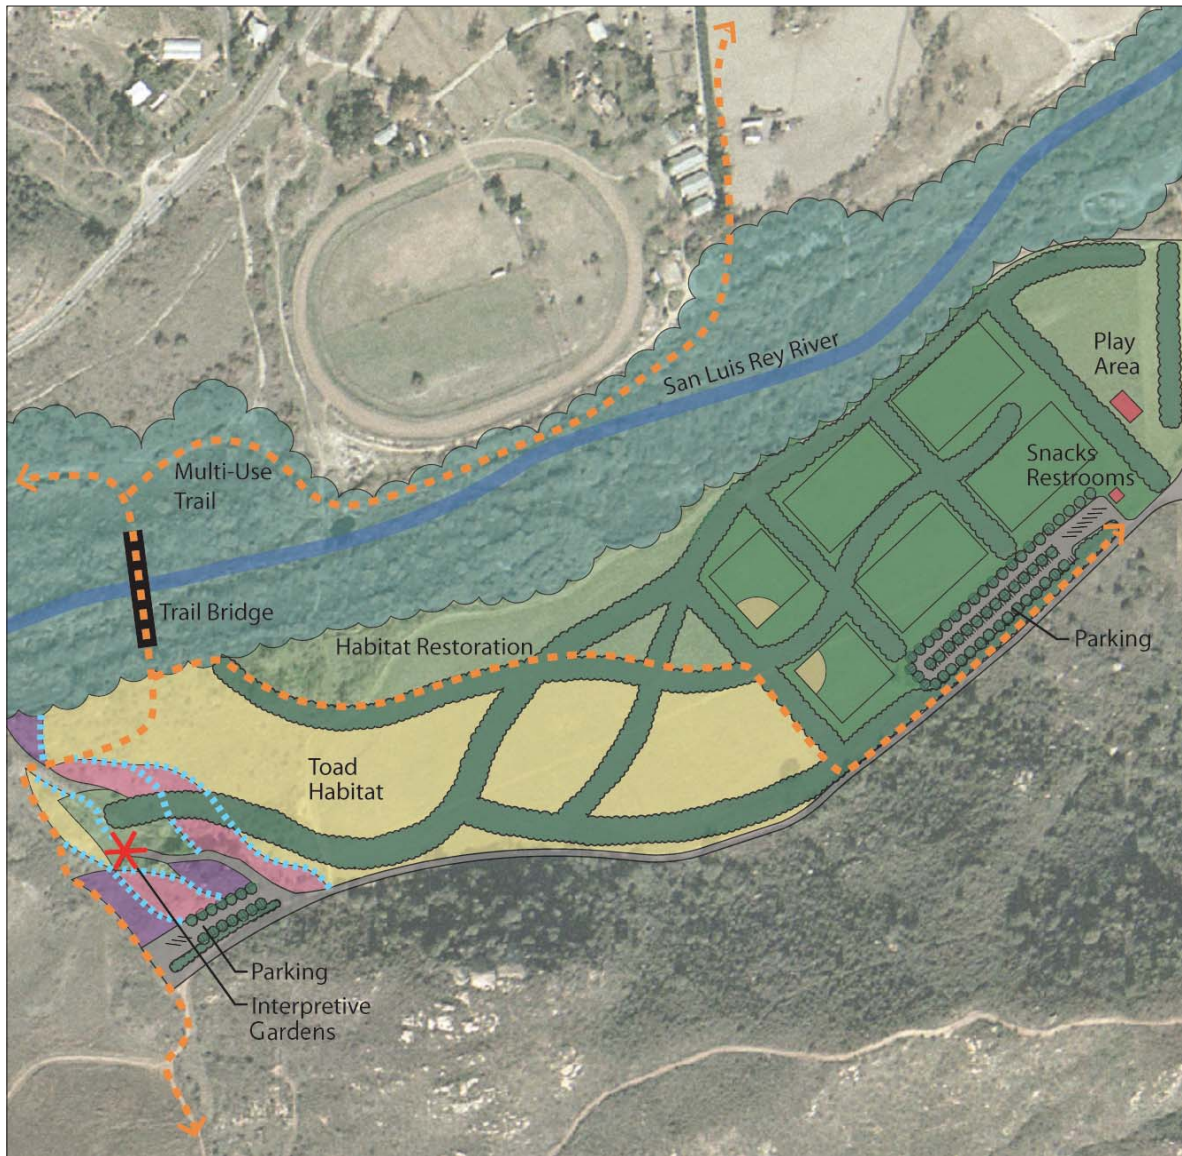

A15- Vicinity Map

A15- Existing Site Conditions

## A15- CONCEPT DESIGN

A15- Concept Design

The Vessels East site is large enough to accommodate a variety of Tier A park uses, including a significant node of active recreation. The concept design shows four soccer fields and two baseball fields set within recreation rooms framed by sinuous bands of trees which provide sideline spectator shading while containing night lighting. A passive play and picnic area on the east edge of the site, also framed by shade trees, separates the retirement community from active recreation.

An Interpretive Gathering Area and Interpretive Gardens would be well located on the western end of the site, closest to the widest riparian zone in the center of the CSA, and isolated from surrounding residential development and noise/ light from I-15. Between the active recreation and interpretive areas, riparian restoration and a toad habitat corridor are proposed. In this configuration, the concept design balances recreational and interpretive needs with habitat restoration and creation.

Combined tree-shaded parking/ staging areas are set along the south side of the site, on higher ground out of the 10-year floodplain. If this site were developed with park uses, a trail bridge would be necessary to connect it other River Park resources.

## ACTIVE RECREATIONAL NODES

The type of material used for the sports fields in the San Luis Rey River Park should take into consideration that natural grass fields need downtime to recover from intense use period. Field closures for recovery should be rotational so that each recreational node has several fields in operation. These field closures should be factored into decisions regarding numbers of fields to include within each active recreation node.

Multiple-field park nodes are recommended as they can share utilities, service, access, and parking facilities while accommodating tournaments. Multi-use fields (overlapping fields) more efficiently accommodate a wider range of activities within a smaller area, but tend to require more maintenance and more frequent closures due to intense/ frequent year-round use.

Additional amenities that should be considered at active recreational nodes are night lighting, parking and bathrooms. Snack bars, picnic tables, and play areas were other amenities that were frequently requested by community members in association with active recreation. Sustainable materials and systems should be utilized whenever possible.

Baseball Player

## PARKING AND STAGING AREAS

Parking and staging areas for the San Luis Rey River Park shall be integrated into the park landscape utilizing natural light-colored surfaces (to reflect heat) and semipermeable paving (to increase infiltration), and shade trees to create a more pleasant environment. Vegetative drainage swales and/or detention areas may be used to filter and infiltrate surface runoff. Combined parking/ staging areas should be located close to access roads and out of the 10-year floodplain. To facilitate horse trailer access, these lots should have diagonal pull-through parking stalls at one end. The number of required parking stalls within each Tier A park site is proportional to qualities of park program on each site. Approximately 66 parking spots should be provided for a single soccer field. For each additional field on the same site, the number of additional required stalls per field decreases.

## TRAILS

Multi-use trails within the San Luis Rey River Park will conform to County standards: 8'-width with a crushed stone or stabilized dirt surface. To the extent possible, the River Park trail network will implement the intention of the County Trails Master Plan. In most locations there will be two multi-use trails within the floodplain, one to the north of the river and the other to the south. A paved bike path along the south side of SR-76, and several small hiker-only trail loops will supplement primary multi-use trails. Official improved trails will follow, where possible, established paths of existing unofficial trails and desire lines.

One or more trail underpass(es) (under SR-76) may be desirable to connect riparian trails with upland trails to the north. If Site A3 is purchased for the River Park, then an underpass at this location would be appropriate. A trail underpass should be tall enough to accommodate a mounted horse and rider. Trail-sharing etiquette should be posted on multi-use trails and enforced by rangers.

As negotiations with property owners unfold, sensitive species locations are assessed, and park nodes are developed, conceptual trail locations will be solidified. In some locations, fencing may be requested by adjacent property owners or required due to the sensitivity of adjacent habitat.

Trail Bridge Precedent

## TRAIL BRIDGES

Trail Bridge Locations

To accomplish the primary goal of providing continuous year-round access throughout the CSA, two or three trail bridges will be required. Most of the river's edge throughout the CSA is shrouded by dense riparian vegetation, and is largely invisible to park users. Trail bridges will allow park users to get out over the water and view the actual floodway and riparian edge, and could become key locations for interpretation and appreciation of the river resources.

The diagram (left) indicates the three best locations for trail bridges, considering park program distribution, desired circulation, access locations, and property ownership. If Site A15, Vessels East, is not acquired by the County, then the bridge near this site would not be necessary. Pre-fabricated modular steel truss bridges would be the most cost effective and least intrusive bridge design. This type of bridge design can span up to 250'. Bridges over the river's broad and shallow floodway would likely need to be several hundred feet long, thus requiring at least one central reinforced concrete support column. The bridges would be constructed above the 100-year flood level, although stair/ ramp access points would be within the 10-year flood zone and would likely need maintenance/ cleaning after significant storm events.

## PARK IMPLEMENTATION

### Land Acquisition

After completion of the Draft SLR River Park Master Plan Document, and before approval of the final Master Plan, the County must complete a programmatic Environmental Impact Report. During this process, the County will begin negotiations with land owners to acquire high priority Tier A sites. The County will only acquire properties from willing sellers. The owners of only five of the fifteen potential Tier A sites identified within the Master Plan are currently willing to discuss the sale of their properties to the County. The acquisition of Tier A sites should be the County's first priority as the park moves toward implementation; only these sites can accommodate the community's active recreational needs. The County has begun to survey two of these Tier A sites to assess value and the appropriateness of acquisition.

### Park Improvements

After acquisition of property, the County could begin detailed design of park improvements. Public participation will be an important component of the detailed design of any significant park improvements. With the exception of the Fallbrook High school site, finalization of the design of Tier A sites should not occur until Caltrans solidifies plans for the expansion/ relocation of SR-76.

As negotiations with property owners proceed, sensitive species locations are assessed, and Tier A park nodes are developed, conceptual trail locations will begin to solidify. If the owners of properties conceptually identified for park trails are not interested in selling, the County should pursue trail easements through those parcels. If trail easements are not possible through a piece of land, trail locations will need to be adjusted to go around unavailable parcels. The goal of creating continuous trails throughout the riparian zone may be only incrementally achievable over a long time period.

### Ongoing Coordination

As plans for the San Luis Rey River Park continue to evolve, it is important that the County continues to coordinate with Caltrans regarding the expansion SR-76. It is the County's intention that Caltrans's required mitigation will be integrated into the open space portion of the SLR River Park. The San Luis Rey River Park planning process should also continue its coordination with the North County MSCP (Multiple Species Conservation Program) to ensure that the River Park adheres to, and helps realize, the conservation objectives of the NCMSCP.

## CONCLUSION

The San Luis Rey River Park will be an outstanding recreational and open space legacy for San Diego County residents. The park balances accommodation of the recreational needs of surrounding communities with the establishment of a large open space preserve, protecting one of the most biologically-diverse segments of the SLR river corridor, and critical habitat for several threatened and endangered species.

Encouraged interaction with the park's wealth of cultural/ biological resources will instill park users with a broad understanding and appreciation for the river's dynamic natural systems and the ecological richness that attracted Native Americans to inhabit the corridor thousands of years ago.
